NORDWERK COMPONENTS GMBH

# Executive Financial Performance Report

January–June 2026 Actual vs Budget | July–September 2026 Forecast

**FICTIONAL TRAINING CASE STUDY — NOT ACTUAL COMPANY DATA**

## 1. Executive summary

Revenue for January–June 2026 was **€2,700,000**, or **€20,000 (0.7%) below budget**. EBITDA was **€369,000**, which was **€22,000 (5.6%) below budget**. The illustrative Q3 Base case forecasts revenue of **€1,468,992** and EBITDA of **€217,760**, with a margin of **14.8%**.

## 2. January–June performance

| KPI | Actual | Budget | Variance |
|---|---|---|---|
| Revenue | €2,700,000 | €2,720,000 | -€20,000 |
| COGS | €1,616,000 | €1,632,000 | -€16,000 |
| Gross Profit | €1,084,000 | €1,088,000 | -€4,000 |
| Operating Expenses | €715,000 | €697,000 | +€18,000 |
| EBITDA | €369,000 | €391,000 | -€22,000 |

COGS was €16,000 below budget, a favourable cost variance. Operating expenses were €18,000 above budget, an unfavourable variance. Gross Profit was €4,000 below budget, and the Opex overspend widened the EBITDA shortfall to €22,000. EBITDA margin was 13.7% actual versus 14.4% budget (0.7 percentage points lower).

## 3. Monthly EBITDA variance

May had the largest monthly EBITDA shortfall at €11,000 below budget. January was €6,000 below; February and March were each €4,000 below; April met budget; and June was €3,000 above budget. The dataset identifies the timing and amount of variances, but not their operational causes.

## 4. Q3 scenario outlook

| Scenario | Q3 Revenue | Q3 EBITDA | EBITDA Margin |
|---|---|---|---|
| Base | €1,468,992 | €217,760 | 14.8% |
| Optimistic | €1,498,372 | €241,370 | 16.1% |
| Downside | €1,432,812 | €169,985 | 11.9% |

The scenario range is driven by monthly revenue growth, COGS as a percentage of revenue and operating expenses. The Optimistic case is not a target or prediction; all three cases are illustrative assumptions.

## 5. Management recommendations

**1.** Investigate May's €11,000 EBITDA shortfall using sales volume, pricing, product mix, production output and one-off cost information.

**2.** Review the €18,000 Opex overspend by cost centre and identify recurring versus one-off expenditure.

**3.** Validate the €16,000 COGS underspend and determine whether the savings are sustainable without affecting quality or delivery.

**4.** Monitor revenue, COGS as a percentage of revenue, Opex and EBITDA monthly against budget and the rolling forecast.

**5.** Obtain the sales pipeline, customer orders, supplier price outlook, production plan and staffing plan before relying on the Q3 forecast.

## 6. Methodology and limitations

This is a fictional training case. All historical actual/budget figures and forecast assumptions are illustrative. The simplified model calculates EBITDA as Gross Profit less Operating Expenses; it does not include separate depreciation and amortisation, interest or tax lines. EBITDA is not net income or cash flow. The dataset does not provide operational drivers sufficient to explain the causes of variances. The report therefore recommends additional investigation rather than claiming unsupported causes.

## Appendix — Model structure

The Excel workbook includes a six-month P&L; model, monthly variance analysis, KPI summary, Q3 forecast assumptions, forecast model, scenario summary, management dashboard and executive summary.
